

TITLE OF THE INVENTION
SPEECH SYNTHESIS APPARATUS, CONTROL METHOD THEREFOR,
AND COMPUTER-READABLE MEMORY

5 BACKGROUND OF THE INVENTION

The present invention relates to a speech synthesis apparatus for performing speech synthesis by using pitch marks, a control method for the apparatus, and a computer-readable memory.

10 Conventionally, processing that synchronizes with pitches has been performed as speech analysis/synthesis processing and the like. For example, in a PSOLA (Pitch Synchronous OverLap Adding) speech synthesis method, synthetic speech is obtained by adding one-pitch speech
15 waveform element pieces in synchronism with pitches.

In this scheme, ^{ai}information (pitch mark) about the position of each pitch ~~must~~ be recorded concurrently with storage of speech waveform data.

In the prior art described above, however, the
20 size of a file on which pitch marks are recorded becomes undesirably large.

SUMMARY OF THE INVENTION

The present invention has been made in
25 consideration of the above problem, and has as its object to provide a speech synthesis apparatus capable

of reducing the size of a file used to manage pitch marks, a control method therefor, and a computer-readable memory.

In order to achieve the above object, a speech
5 synthesis apparatus according to the present invention has the following arrangement.

There is provided a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

10 ~~first calculation means for calculating a distance between first two pitch marks of a voiced portion of speech data to be processed;~~

~~second calculation means for calculating a difference between adjacent inter-pitch-mark distances;~~

15 and

management means for storing the calculation results obtained by the first and second calculation means in a file and managing the results.

In order to achieve the above object, a speech
20 synthesis apparatus according to the present invention has the following arrangement.

There is provided a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

25 first comparison means for, when a length of speech data to be processed is represented by d, and a

maximum value d_{max} and a minimum value d_{min} are defined for a predetermined word length, comparing the length d with the maximum value d_{max} ;

second comparison means for comparing the length d with the minimum value d_{min} on the basis of the comparison result obtained by the first comparing means;

INS a4
subtraction means for subtracting the maximum value d_{max} or minimum value d_{min} from the length d on the basis of the comparison results obtained by the first and second comparison means; and

005020 25025200
management means for storing the difference obtained by the subtraction means or the length d in the file and managing the difference or the length on the basis of the comparison results obtained by the first and second comparison means.

In order to achieve the above object, a speech synthesis apparatus according to the present invention has the following arrangement.

There is provided a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

INS a5
storage means for storing a file for managing a distance between first two pitch marks of a voiced portion of speech data to be processed and a difference between adjacent inter-pitch-mark distances;

first loading means for loading the distance

between the first two pitch marks of the voiced portion;

second loading means for loading the difference between the adjacent inter-pitch-mark distances; and

INS
a6
5 calculation means for calculating a next pitch mark position from a pitch mark position calculated immediately before the calculation, a pitch mark distance to an adjacent pitch mark, and the distance and difference loaded by the first and second loading means.

INS
a7
10 In order to achieve the above object, a control method for a speech synthesis apparatus according to the present invention has the following steps.

There is provided a control method for a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

INS
a7
15 the first calculation step of calculating a distance between first two pitch marks of a voiced portion of speech data to be processed;

INS
a8
the second calculation step of calculating a difference between adjacent inter-pitch-mark distances;

20 and

INS
a9
the management step of storing the calculation results obtained in the first and second calculation steps in a file and managing the results.

25 In order to achieve the above object, a control method for a speech synthesis apparatus according to the present invention has the following steps.

There is provided a control method for a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

INS a10
5 the first comparison step of, when a length of speech data to be processed is represented by d , and a maximum value d_{\max} and a minimum value d_{\min} are defined for a predetermined word length, comparing the length d with the maximum value d_{\max} ,

INS a11
10 the second comparison step of comparing the length d with the minimum value d_{\min} on the basis of the comparison result obtained in the first comparing step;

INS a12
15 the subtraction step of subtracting the maximum value d_{\max} or minimum value d_{\min} from the length d on the basis of the comparison results obtained in the first and second comparison steps; and

INS a13
20 the management step of storing the difference obtained in the subtraction step or the length d in the file and managing the difference or the length on the basis of the comparison results obtained in the first and second comparison steps.

In order to achieve the above object, a control method for a speech synthesis apparatus according to the present invention has the following steps.

25 There is provided a control method for a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

INS a14
the storage step of storing a file for managing a distance between first two pitch marks of a voiced portion of speech data to be processed and a difference between adjacent inter-pitch-mark distances;

INS a15 5 the first loading step of loading the distance between the first two pitch marks of the voiced portion;

INS a16 the second loading step of loading the difference between the adjacent inter-pitch-mark distances; and

INS a17 10 the calculation step of calculating a next pitch mark position from a pitch mark position calculated immediately before the calculation, a pitch mark distance to an adjacent pitch mark, and the distance and difference loaded in the first and second loading steps.

In order to achieve the above object, a computer-readable memory according to the present invention has the following program codes.

There is provided a computer-readable memory storing program codes for controlling a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

INS a18 a program code for the first calculation step of calculating a distance between first two pitch marks of a voiced portion of speech data to be processed;

INS a19 25 a program code for the second calculation step of calculating a difference between adjacent inter-pitch-mark distances; and

a program code for the management step of storing the calculation results obtained in the first and second calculation steps in a file and managing the results.

In order to achieve the above object, a computer-readable memory according to the present invention has the following program codes.

There is provided a computer-readable memory storing program codes for controlling a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

INS
a20
a program code for the first comparison step of, when a length of speech data to be processed is represented by d, and a maximum value dmax and a minimum value dmin are defined for a predetermined word length, comparing the length d with the maximum value dmax;

a program code for the second comparison step of comparing the length d with the minimum value dmin on the basis of the comparison result obtained in the first comparing step;

INS
a21
a program code for the subtraction step of subtracting the maximum value dmax or minimum value dmin from the length d on the basis of the comparison results obtained in the first and second comparison steps; and

a program code for the management step of storing the difference obtained in the subtraction step or the length d in the file and managing the difference or the

length on the basis of the comparison results obtained in the first and second comparison steps.

In order to achieve the above object, a computer-readable memory according to the present invention has
5 the following program codes.

There is provided a computer-readable memory storing program codes for controlling a speech synthesis apparatus for performing speech synthesis by using pitch marks, comprising:

10 a program code for the storage step of storing a file for managing a distance between first two pitch marks of a voiced portion of speech data to be processed and a difference between adjacent inter-pitch-mark distances;

15 a program code for the first loading step of loading the distance between the first two pitch marks of the voiced portion;

a program code for the second loading step of loading the difference between the adjacent inter-pitch-mark distances; and
20

a program code for the calculation step of calculating a next pitch mark position from a pitch mark position calculated immediately before the calculation, a pitch mark distance to an adjacent pitch mark, and the
25 distance and difference loaded in the first and second loading steps.

Other features and advantages of the present invention will be apparent from the following description taken in conjunction with the accompanying drawings, in which like reference characters designate
5 the same or similar parts throughout the figures thereof.

5 DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS
[First Embodiment]

Fig. 1 is a block diagram showing the arrangement of a speech synthesis apparatus according to the first embodiment of the present invention.

10 Reference numeral 103 denotes a CPU for performing numerical operation/control, control on the respective components of the apparatus, and the like, which are executed in the present invention; 102, a RAM serving as a work area for processing executed in the present
15 invention, a temporary saving area for various data and having an area for storing a pitch mark data file 101a; 101, a ROM storing various control programs such as programs executed in the present invention, for managing pitch mark data used for speech synthesis; 109, an
20 external storage unit serving as an area for storing processed data; and 105, a D/A converter for converting the digital speech data synthesized by the speech synthesis apparatus into analog speech data and outputting it from a loudspeaker 110.

Reference numeral 106 denotes a display control unit for controlling a display 111 when the processing

state and processing results of the speech synthesis apparatus, and a user interface are to be displayed; 107, an input control unit for recognizing key information input from a keyboard 112 and executing the designated processing; 108, a communication control unit for controlling transmission/reception of data through a communication network 113; and 104, a bus for connecting the respective components of the speech synthesis apparatus to each other.

10 Pitch mark data file generation processing executed in the first embodiment will be described next with reference to Fig. 2.

15 Fig. 2 is a flow chart showing pitch mark data file generation processing executed in the first embodiment of the present invention.

As shown in Fig. 3, pitch marks $p_1, p_2, \dots, p_i, p_{i+1}$ are arranged in each voiced portion at certain intervals, but no pitch mark is present in any unvoiced portion.

20 First of all, it is checked in step S1 whether the first segment of speech data to be processed is a voiced or unvoiced portion. If it is determined that the first segment is a voiced portion (YES in step S1), the flow advances to step S2. If it is determined that the first segment is an unvoiced portion (NO in step S1), the flow
25 advances to step S3.

In step S2, voiced portion start information

indicating that "the first segment is a voiced portion" is recorded. In step S4, a first inter-pitch-mark distance (distance between the first pitch mark p_1 and the second pitch mark p_2 of the voiced portion) d_1 is
5 recorded in the pitch mark data file 101a. In step S5, the value of a loop counter i is initialized to 2.

It is then checked in step S6 whether the voiced portion ends with the i th pitch mark p_i indicated by the value of the loop counter i . If it is determined that
10 the voiced portion does not end with the pitch mark p_i (NO in step S6), the flow advances to step S7 to obtain the difference ($d_i - d_{i-1}$) between an inter-pitch-mark distance d_i and an inter-pitch-mark distance d_{i-1} . In step S8, the obtained difference ($d_i - d_{i-1}$) is recorded
15 in the pitch mark data file 101a. In step S9, the loop counter i is incremented by 1, and the flow returns to step S6.

INS
029
If it is determined that the voiced portion ends (YES in step S6), the flow advances to step S10 to
20 record a voiced portion end signal indicating the end of the voiced portion in the pitch mark data file 101a. Note that any signal can be used as the voiced portion end signal as long as it can be discriminated from an inter-pitch-mark distance. In step S11, it is checked
25 whether the speech data has ended. If it is determined that the speech data has not ended (NO in step S11), the

flow advances to step S12. If it is determined that the speech data has ended (YES in step S11), the processing is terminated.

INS
a30

5 It is determined in step S1 that the first segment of the speech data is an unvoiced portion (NO in step S1), the flow advances to step S3 to record unvoiced portion start information indicating that "the first segment is an unvoiced portion" in the pitch mark data file 101a. In step S12, a distance d_s between the voiced portion and the next voiced portion (i.e., the length of the unvoiced portion) is recorded in the pitch mark data file 101a. In step S13, it is checked whether the speech data has ended. If it is determined that the speech data has not ended (NO in step S13), the flow advances to 10 step S4. If it is determined that the speech data has ended (YES in step S13), the processing is terminated.

INS
a31

As described above, according to the first embodiment, since the respective pitch marks in each voiced portion are managed by using the distances 20 between the adjacent pitch marks, all the pitch marks in each voiced portion need not be managed. This can reduce the size of the pitch mark data file 101a.

INS
a32

25 In the first embodiment, step S10 may be replaced with step S14 of counting the number (n) of pitch marks in each voiced portion and step S15 of recording the counted number n of pitch marks in the pitch mark data

file 101a, as shown in Fig. 4. In this case, the processing in step S6 amounts to checking whether the value of the loop counter i is equal to the number n of pitch marks.

5 Another example of the processing of recording pitch marks of each voiced portion in the first embodiment will be described with reference to Fig. 5.

10 Fig. 5 is a flow chart showing another example of the processing of recording pitch marks of each voiced portion in the first embodiment of the present invention.

For example, the data length of speech data to be processed is represented by d , and a maximum value d_{\max} (e.g., 127) and a minimum value d_{\min} (e.g., -127) are defined for a given word length (e.g., 8 bits).

15 First of all, in step S16, d is compared with d_{\max} .
 ^{a33} If d is equal to or larger than d_{\max} (YES in step S16), the flow advances to step S17 to record the maximum value d_{\max} in the pitch mark data file 101a. In step S18, d_{\max} is subtracted from d , and the flow returns to step
20 S16. If it is determined that d is smaller than d_{\max} (NO in step S16), the flow advances to step S19.

 In step S19, d is compared with d_{\min} . If d is equal to or smaller than d_{\min} (YES in step S19), the flow advances to step S20 to record the minimum value
25 d_{\min} in the pitch mark data file 101a. In step S21, d_{\min} is subtracted from d , and the flow returns to step S19.

If it is determined that d is larger than d_{min} (NO in step S19), the flow advances to step S22 to record d . The processing is then terminated.

With this recording, for example, $d_{min}-1$ (-128 in the above case) can be used as a voiced portion end signal.

[Second Embodiment]

INS a34
10 In the second embodiment, pitch mark data file loading processing of loading data from the pitch mark data file 101a recorded in the first embodiment will be described with reference to Fig. 6.

INS a35
Fig. 6 is a flow chart showing pitch mark data file loading processing executed in the second embodiment of the present invention.

INS a36
15 First of all, in step S23, start information indicating whether the start of speech data to be processed is a voice or unvoiced portion, is loaded from a pitch mark data file 101a. It is then checked in step S24 whether the loaded start information is voiced
20 portion start information. If voiced portion start information is determined (YES in step S24), the flow advances to step S25 to load a first inter-pitch-mark distance (distance between a first pitch mark p_1 and a second pitch mark p_2 of the voiced portion) d_1 from the
25 pitch mark data file 101a. Note that the second pitch mark p_2 is located at p_1+d_1 .

005000 00000000

INS
a37

In step S26, the value of a loop counter i is initialized to 2. In step S27, a difference d_r (data corresponding the length of one word) from the pitch mark data file 101a. In step S28, it is checked whether the loaded difference d_r is a voiced portion end signal. If it is determined that the difference is not a voiced portion end signal (NO in step S28), the flow advances to step S29 to calculate a next inter-pitch-mark distance d_i and pitch mark position p_{i+1} from a pitch mark position p_i , inter-pitch-mark distance d_{i-1} , and d_r obtained in the past.

INS
a38

The following equations can be formulated from p_i , d_{i-1} , d_r , d_i , and p_{i+1} . The next inter-pitch-mark distance d_i and pitch mark position p_{i+1} can be calculated by using these equations.

$$d_i = d_{i-1} + d_r \quad \dots (1)$$

$$p_{i+1} = p_i + d_i \quad \dots (2)$$

In step S30, the loop counter i is incremented by 1. The flow then returns to step S27.

If it is determined that d_r is a voiced portion end signal (YES in step S28), the flow advances to step S31 to check whether the speech data has ended. If it is determined that the speech data has not ended (NO in step S31), the flow advances to step S32. If it is determined that the speech data has ended (YES in step S31), the processing is terminated.

and a voiced portion end signal are defined for a given word length (e.g., 8 bits) in Fig. 5.

INS
a41

First of all, in step S34, the register d is initialized to 0. In step S35, the data d_r corresponding
5 the length of one word is loaded from the pitch mark data file 101a. It is then checked in step S36 whether d_r is a voiced portion end signal. If it is determined that the d_r is a voiced portion end signal (YES in step S36), the processing is terminated. If it is determined
10 that d_r is not a voiced portion end signal (NO in step S36), the flow advances to step S37 to add d_r to the contents of the register d.

005000" 25029200

In step S38, it is checked whether d_r is equal to d_{max} or d_{min} . If it is determined that they are equal
15 (YES in step S38), the flow returns to step S35. If it is determined that they are not equal (NO in step S38), the processing is terminated.

INS
a42

Note that the present invention may be applied to either a system constituted by a plurality of equipments
20 (e.g., a host computer, an interface device, a reader, a printer, and the like), or an apparatus consisting of a single equipment (e.g., a copying machine, a facsimile apparatus, or the like).

The objects of the present invention are also
25 achieved by supplying a storage medium, which records a program code of a software program that can realize the

functions of the above-mentioned embodiments to the system or apparatus, and reading out and executing the program code stored in the storage medium by a computer (or a CPU or MPU) of the system or apparatus.

5 In this case, the program code itself read out from the storage medium realizes the functions of the above-mentioned embodiments, and the storage medium which stores the program code constitutes the present invention.

10 As the storage medium for supplying the program code, for example, a floppy disk, hard disk, optical disk, magneto-optical disk, CD-ROM, CD-R, magnetic tape, nonvolatile memory card, ROM, and the like may be used.

15 The functions of the above-mentioned embodiments may be realized not only by executing the readout program code by the computer but also by some or all of actual processing operations executed by an OS (operating system) running on the computer on the basis of an instruction of the program code.

20 Furthermore, the functions of the above-mentioned embodiments may be realized by some or all of actual processing operations executed by a CPU or the like arranged in a function extension board or a function extension unit, which is inserted in or connected to the
25 computer, after the program code read out from the storage medium is written in a memory of the extension
